

ISDS Connector Product

ISDS Connector Data mailboxes significantly change the way of communication with state authorities and with other legal entities. However, the data mailbox only ensures that the document is delivered to the particular legal entity and does not perform any subsequent tasks relating to distribution of the particular document to the particular recipient within the organization, its secure storage, or archiving. A data message stored in a legal entity's data mailbox is deleted after three months unless it is archived or converted into documentary form. Process automation with ISDS Connector IXTENT's Data Mailbox Connector represents a complex solution for receiving, sending, and management of messages in data mailboxes, as well as their integration with enterprise information systems of all types. You thus gain full control over data messages and there is no risk of delay with their processing.

IXTENT offers ISDS Connector versions for:

- › e-mail server,
- › MS SharePoint,
- › SAP and other ERP,
- › records management,
- › Document Management System (DMS) and Enterprise Content Management System (ECM).

@ ISDS Connector

Main benefits:

- › Automatic checking for new incoming data messages
- › Possibility of managing multiple data mailboxes
- › Automatic delivery of data messages to the persons responsible for their processing
- › Detailed recording and fast traceability
- › Replying in data message format directly from your IS environment
- › Long-term and secure storage of data messages

Benefits of the ISDS Connector:

Automatic checking for new messages.

The Connector automatically monitors new messages in the data mailbox and any newly received messages are stored at relevant location within the required IS.

Support for multiple data mailboxes.

The Data Mailbox Connector can simultaneously administer multiple mailboxes. If your organization has multiple data mailboxes, you can manage them from one place.

Automatic distribution of data messages to the persons responsible for their processing.

Data messages are distributed to responsible persons for processing on the groundwork of customer defined workflow.

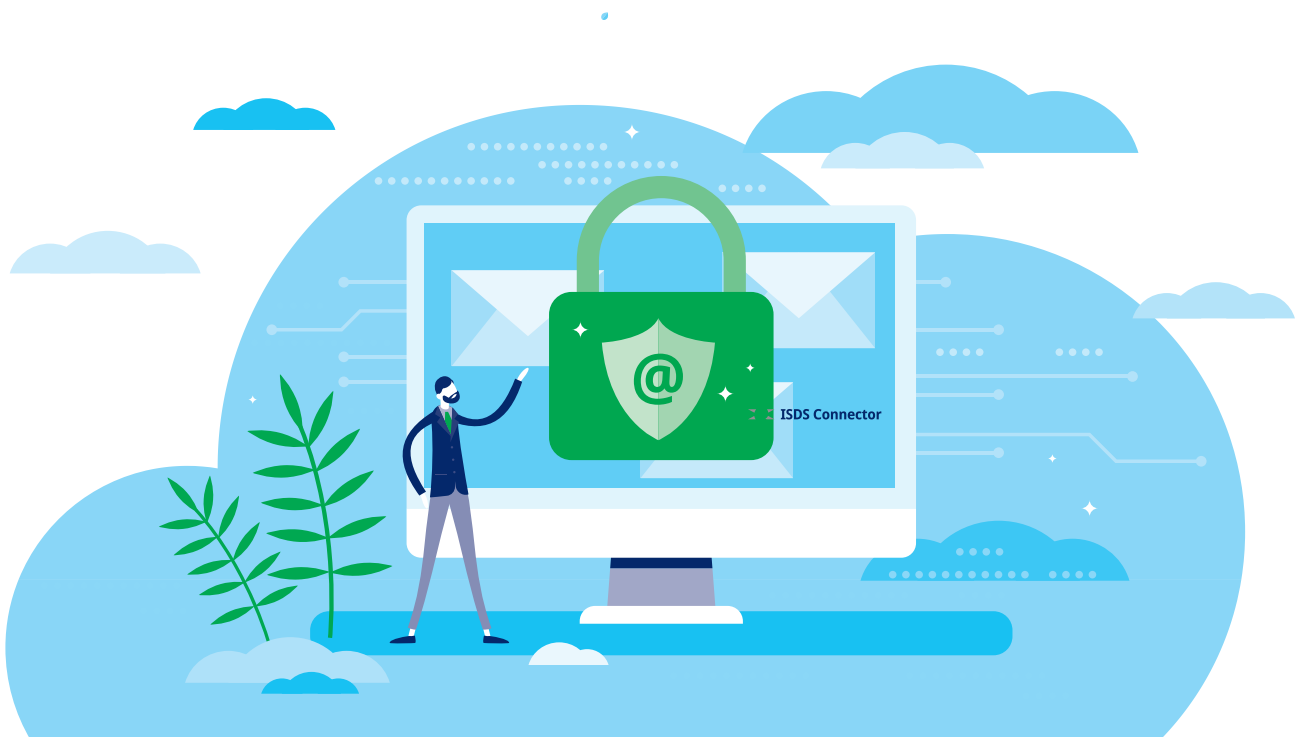

Detailed records and fast retrieval.

Enables monitoring and easy retrieval of each document. It also provides control over data and document flow (there are audit records available for individual activities relating to their processing).

Replying in data message format directly from your IS environment.

Long-term and secure storage of messages.

You can securely archive the data messages for an unlimited time.
